Projection variability of clausal complements across different operators

Lisa Hofmann¹ Marie-Catherine de Marneffe² Judith Tonhauser¹

¹University of Stuttgart ²UC Louvain

Does the projection of content differ across entailment-canceling environments?

- ► Yes! Projection differs by entailment-cancelling operator
- ► By-operator effects differ by predicate (operator)/predicate interaction)
- Current theories of projective content do not predict our results

Projection of clausal complements

Do you infer that Rachel is committed to the truth of the content of the complement (CC), that <u>Julian dances salsa?</u>

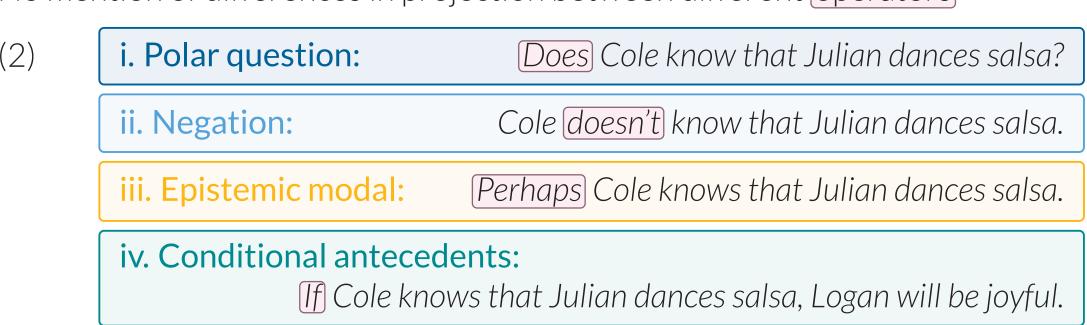

- Rachel: 'Does Cole know that Julian dances salsa?'
 - ✓ Yes, CC projects out of the question
 - Rachel: 'Does Cole (think) that Julian dances salsa?'
 - X No, CC does not project

Frege (1892); Strawson (1950); Kiparsky and Kiparsky (1970); Karttunen (1971); Karttunen and Peters (1979), and many more

Entailment-cancelling operators

Family-of-sentences test:

No mention of differences in projection between different operators

Hints at by-operator variation

Ö 0.85 -

0.80

(Degen and Tonhauser 2022)

(e.g. Chierchia and McConnell-Ginet 1990; Coppock and Champollion 2020)

- Karttunen (1971) proposes **factive vs semi-factive** distinction
- Smith & Hall (2014): Experiment with **English projective contents** Effect of operator differs by projective content
- Sieker & Solstad (2022): Exp. with German clause-embedding predicates
- No by-predicate variation, no evidence for factive/semi-factive distinction

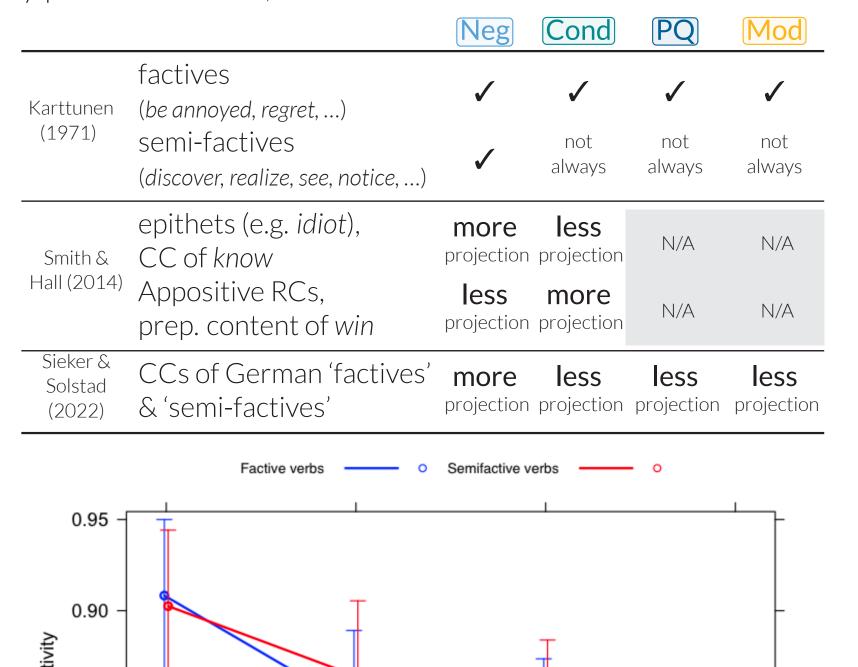

Figure 1. Sieker & Solstad 2022, p. 286: Projection-ratings by embedding operator, for purported factive and semi-factive predicates

'Certain-that' task for projection inferences **Christopher:** "Cole didn't discover that Julian dances salsa." Is Christopher certain that Julian dances salsa? yes Next

Tonhauser (2016); Djärv and Bacovcin (2017); Tonhauser et al. (2018); de Marneffe et al. (2019); Mahler (2020); Degen and Tonhauser (2022); Sieker and Solstad (2022)

Variation among clause-embedding predicates

20 predicates that have shown projection variability in PQs

rating 8.0

Figure 2. Degen and Tonhauser 2022, p. 562: Mean certainty ratings by predicate

Materials

To assess the effect of operator and predicate on projection:

4 experiments (roughly 750 participants each)

- One per operator: polar questions, negation, modal perhaps, conditional Participants saw:
- 20 clause embedding predicates
- Crossed with 20 CCs ($20 \times 20 = 400$ combinations)
- (6 controls for exclusion)

(Experiments also used different at-issueness measures in separate block, not analyzed here)

Effects of operator & predicate on projection

By-operator variation aggregating across predicates (Figure 3)

Conditional > Question > Negation, Modal

Model #1: Linear mixed effect regression response: **certainty ratings**; fixed effect: **operator**) (base level: Question); random intercepts: participants, items; MLEs: question (intercept) 0.51, conditional +0.05, modal -0.04, negation -0.03; with all p < 0.001

- But small differences, as in Sieker & Solstad's (2022) study
- Sieker & Solstad's results for German: Negation > Question, Conditional, Modal

Effect of operator differs by predicate (Figure 4), e.g.

CC of be annoyed: Question, Negation > Conditional, Modal

Model #2: Linear mixed effect regression response: **certainty ratings**; fixed effects: **operator**, **predicate**, and interaction (base IvI: **be annoyed** / negation); random intercepts: participant; MLEs: negation (intercept) 0.87, conditional -0.12, modal -0.16; (p < 0.001); question +0.02 (n.s.)

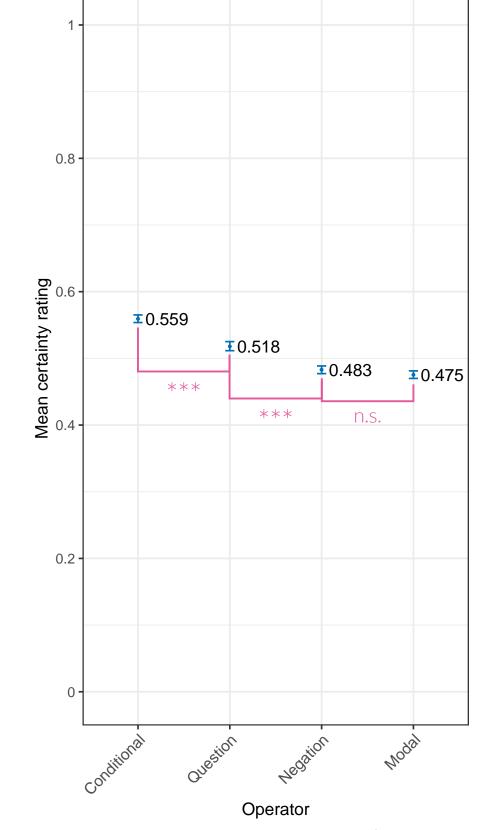

CC of know: Question > Negation, Conditional > Modal

Model #3: Linear mixed effect regression response: certainty ratings; fixed effects: operator, predicate, and interaction (base level: know / negation); random intercepts: participant;

MLEs: negation (intercept) 0.79, modal -0.14, question +0.08; with p < 0.001; , conditional +/-0, (n.s.)

CC of discover: Conditional, Question > Negation > Modal Model #4: Linear mixed effect regression

response: certainty ratings; fixed effects: (operator), (predicate), and interaction (base level: discover / negation); random intercepts: participant: MLEs: negation (intercept) 0.68, conditional +0.11, question +0.10, modal -0.06; with p < 0.001

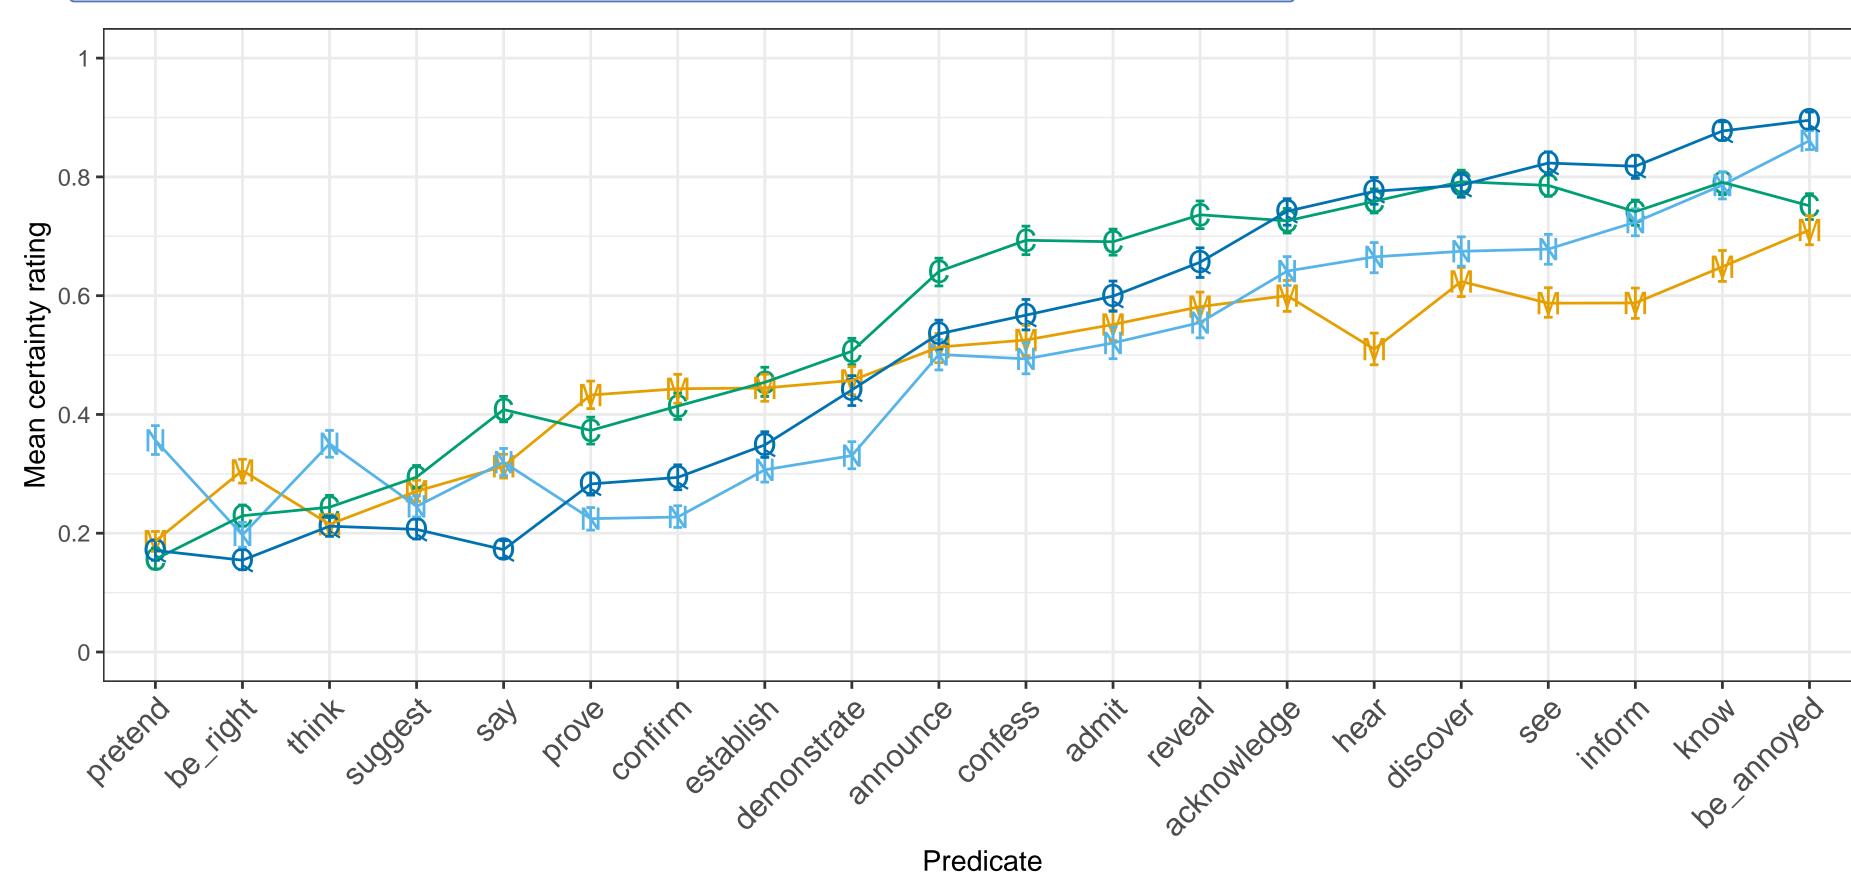

Figure 4. Mean certainty ratings by predicate with 95% bootstrapped confidence intervals, grouped by operator. Entailment-cancelling operator coded by letter and color: N: negation, M: modals, C: conditional antecedents, Q: polar questions.

Discussion — By-predicate variation in the effect of operator

- Concurs with Smith & Hall (2014), who found content/operator interactions for English projective contents
- Differs from Sieker & Solstad (2022): found no predicate/operator interaction for CCs of German clause-embedding predicates

No evidence for factive vs. semi-factive distinction (Karttunen 1971)

- CC of purported factive be annoyed does not invariably project across operators
- CC of purported semi-factives (discover, see) do not project more across negation than other operators

Provides support (from negation, modals, conditionals) for Degen & Tonhauser's (2022) result:

Projection does not categorically differentiate between (semi-)factive/-factive predicates

Existing theories of projection do not predict our results

Dynamic accounts of projection: Lexical triggering + dynamic semantics

Distinguish factive and non-factive predicates: • <u>factive</u> predicates (*be annoyed, regret, ...*): CC conventionally required to be contextually entailed in common ground

• non-factive predicates (believe, say, ...): no such requirement

Factive content projects globally, unless not admitted by common ground

Lexical entailments + discourse-based triggering

Distinguish veridical predicates (CC is entailed) from non-veridical ones:

• veridical predicates (be right, demonstrate, ...): entailed CC projects if not at-issue

• non-veridical predicates (believe, say, ...): no predictions / CC projects if required by discourse coherence

Contextual entailments + triggering based on cognitive inertness

(Schlenker 2021) Potential of projection for contents that are contextually entailed (given a context C and the utterance U), including inferences from:

(Heim 1992; van der Sandt 1992)

(Abrusán 2011; Simons et al. 2017)

Contextual entailments +

triggering based on cognitive inertness

May be extended to our data by

 Lexically veridical predicates 'Distributed veridicality' contexts (Roberts 2019)

(Cole {was not wrong, can't believe} that Julian dances salsa.)

Other sources of contextual inference

Our data

interaction

Superadditive predicate/operator

((Cole is honest + knowledgeable.) Cole said that Julian dances salsa.)

Lexical entailments +

discourse-based triggering

No systematic predictions for how

Contextually entailed CC projects if it is an epistemic precondition of \mathbf{U} in \mathbf{C} (it is typically/likely already known). **Predictions**

Lexical triggering +

dynamic semantics

Meaning of entailment-canceling

veridicality or at-issueness interact making explicit how combinations of operators (invariably) encodes interaction with conventional content with the meaning of operator + predicate are associated entailment-canceling operators of embedded factives with contextual inferences Projection variability for all predicates Projection for some non-factive (/non-veridical) No predictions for non-factive No systematic predictions for Makes predictions about CCs of all predicates as high as for some factive (/veridical) non-veridical predicates clause-embedding predicates predicates ones (see also D&T'22) Out-of-the-blue contexts Veridical predicates: analyses may be "Out-of-the-blue" contexts do not Projection variability in the out-of-the-blue extended by assuming that the CCs of Consistent projection of factive CCs warrant assumption of contextual contexts used in experiment (see also D&T'22) veridical predicates differ in entailment: No projection expected at-issueness in out-of-the-blue contexts

Theoretical implications

- Previous work: projection analyses need to consider the effect of lexical meaning (e.g. Kiparsky and Kiparsky 1970; Karttunen 1971, et. seq.), world knowledge (de Marneffe et al. 2012; Degen and Tonhauser 2021), and discourse structure (e.g. Simons et al. 2017; Tonhauser et al. 2018)
- Add to that the effect of various entailment-cancelling operators
- An analysis of projection needs to be able to address operator / predicate interaction effects.
